

Orchestration Fundamentals for Agentic Development

This course is designed to introduce the core skills for planning and running multi-agent development work with Claude Code. Participants will practice breaking features into agent-ready units of work, choosing the right model for each task, and running multiple agent sessions in parallel.

Audience

This course is ideal for:

- Developers moving from single-prompt AI assistance to orchestrating multiple agents on larger tasks
- Tech leads and engineers responsible for planning and delegating agentic development work

Prerequisites

To get the most out of this session, participants should have:

- Experience using Claude Code or a similar AI coding assistant for development tasks
- Working knowledge of Git, including creating branches and merging changes
- Comfort navigating and running commands from a terminal

Learning Objectives

After this course, participants will be able to:

- Break down complex features into units of work suited for agent execution
- Select an appropriate model for a task based on its complexity, risk, and cost
- Run and coordinate multiple Claude Code sessions on related subtasks

Duration

4 hours

Outline

Decomposing Complex Features for Multi-Agent Execution

- What makes a task a good fit for an agent to run on its own
- Breaking a feature into smaller units of work an agent can complete and you can verify
- Writing task specs and acceptance criteria an agent can work from
- Sequencing subtasks that depend on each other or share resources

Model Selection Strategy for Agentic Development

- Matching the model strength to how complex or risky a task is
- Weighing speed and cost against reasoning quality
- Knowing when to switch to a stronger model mid-task

Orchestrating Multiple Agent Sessions

- Setting up a workspace to run several Claude Code sessions at once
- Managing shared context, branches, and file boundaries across sessions
- Coordinating handoffs and merging results from agents working on related subtasks
